Extracting large-x structure functions (and LHC connections)

Alberto Accardi

Hampton U. and Jefferson Lab

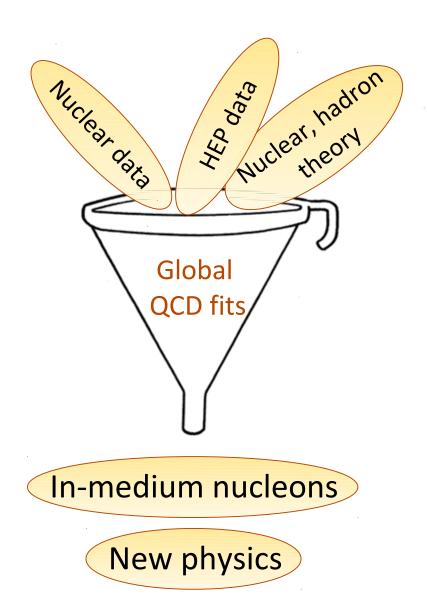

Gordon Research Conference on "Photonuclear Reactions" August 5-10, 2012

"The coherence provided by QCD means that insights [into hadron structure] may arise from unexpected quarters.

It is more than ever advisable to take a broad view that integrates across hadronic physics, and to connect with the rest of subatomic physics."

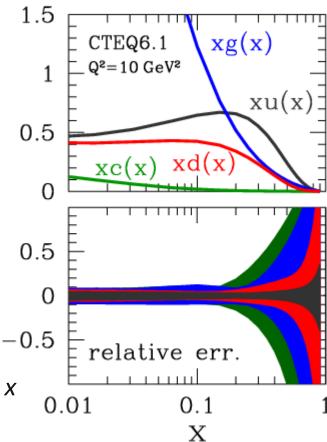

C. Quigg, 2011

"The Future of Hadrons: The Nexus of Subatomic Physics"
Talk at "Hadron 2011", arXiv:1109.5814

Why large x?

- Large (experimental) uncertainties in Parton Distribution Functions (PDFs)
- Precise PDFs at large x are needed, e.g.,
 - Non-perturbative nucleon structure:
 - d/u, $\Delta u/u$, $\Delta d/d$ at $x \rightarrow 1$
 - at LHC, Tevatron
 - New physics as excess on QCD large p_τ spectra ⇔ large x PDF
 - Forward physics
 - At RHIC:
 - Spin structure of the nucleon at small x
 - Neutrino oscillations, ...

Valence quarks at large x

At large x, valence u and d extracted from p and n DIS structure functions

$$F_2^p \approx \frac{4}{9}u_v + \frac{1}{9}d_v$$
$$F_2^n \approx \frac{1}{9}u_v + \frac{4}{9}d_v$$

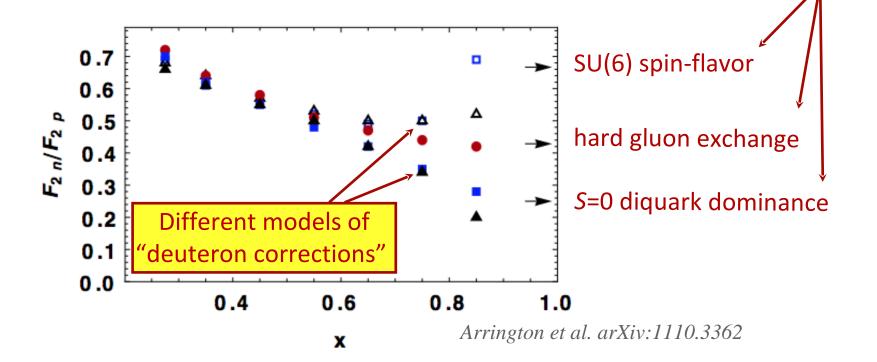

- u quark distribution well determined from proton data
- d quark distribution requires neutron structure function

$$\frac{d}{u} \approx \frac{4 - F_2^n / F_2^p}{4F_2^n / F_2^p - 1}$$

But... deuteron corrections!

- Absence of free neutron targets
 - \Rightarrow use deuterons (weakly bound p and n)

Non-perturbative proton models

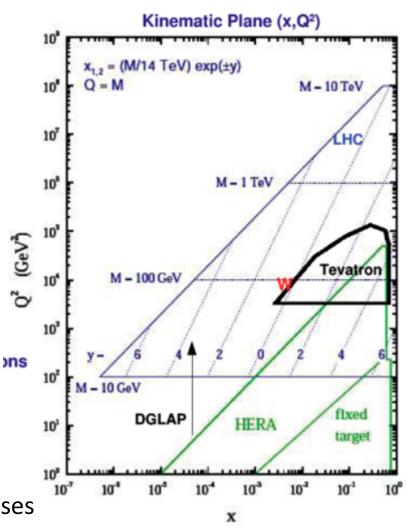

- \Box Deuteron model dependence obscures free neutron at large x
 - We will see quantitatively how much

Large x at colliders - new physics searches

- lacksquare Remember, $x=rac{M}{\sqrt{s}}e^y$
- Examples:
 - Z' production $M_Z'\gtrsim 1~{
 m TeV}$
 - Higgs at forward rapidity: y > 2

$$x > 0.1$$
 (LHC)
 $x > 0.5$ (Tevatron)

- Precise large-x PDFs needed to:
 - reduce QCD background
 - optimize searches involving large masses
 - precisely characterize new particle properties

The CTEQ-JLab fits

The CTEQ-JLab collaboration

Collaborators:

 A.Accardi, E.Christy, C.Keppel, W.Melnitchouk, P.Monaghan, J.Owens (J.Morfín, L.Zhu)

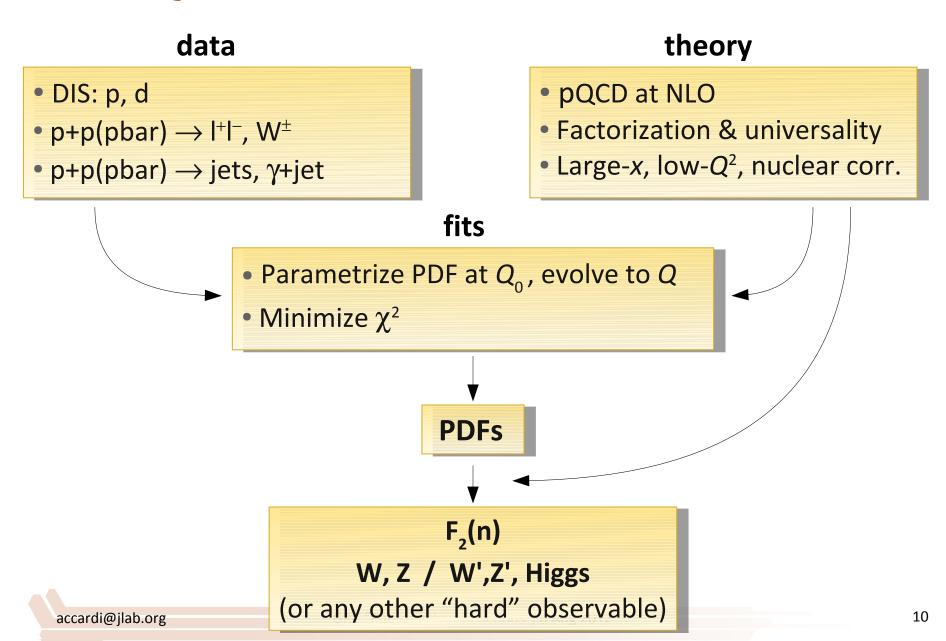

Goals:

- Global QCD fits of unpolarized PDFs focused on large x
- Improve the PDF experimental precision ("PDF errors")
 by enlarging the fitted data set
- Include all relevant large-x / small- Q^2 theory corrections
- Quantitatively evaluate theoretical systematic errors
- Use PDFs as tools for nuclear and particle physics

Papers:

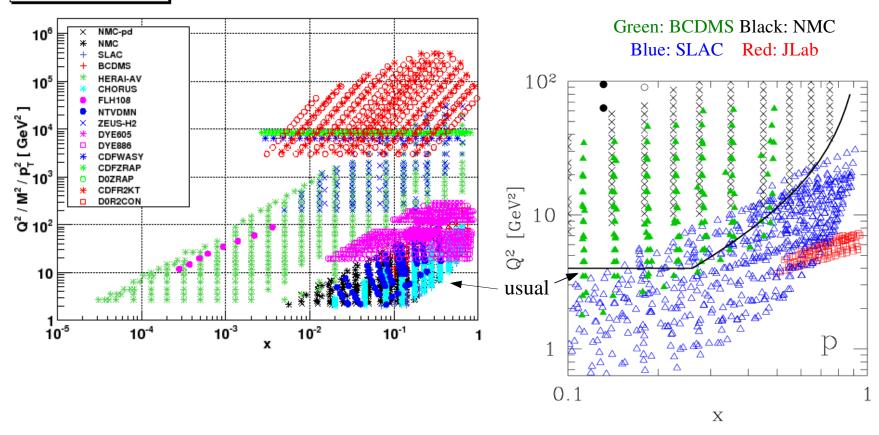

- A.Accardi et al., Phys.Rev.D81 (2010) 034016 "CJ10"
- A.Accardi et al., Phys.Rev.D84 (2011) 014008 "CJ11"

Global QCD fits of Parton Distribution Functions

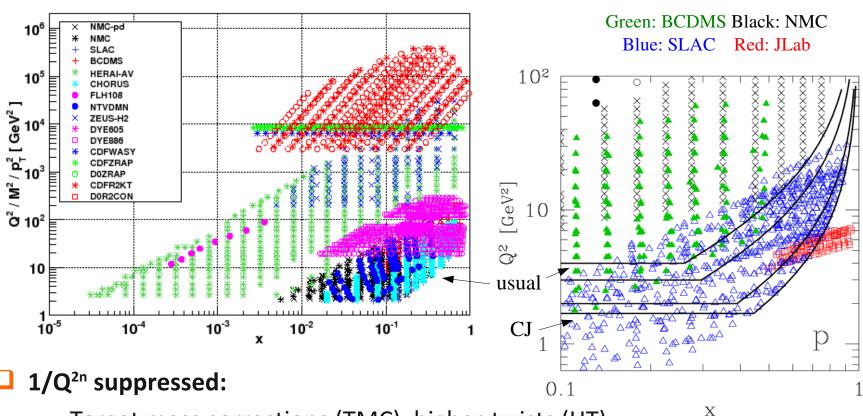

Large-x, small-Q² corrections

NNPDF2.0 dataset

Large-x, small-Q² corrections

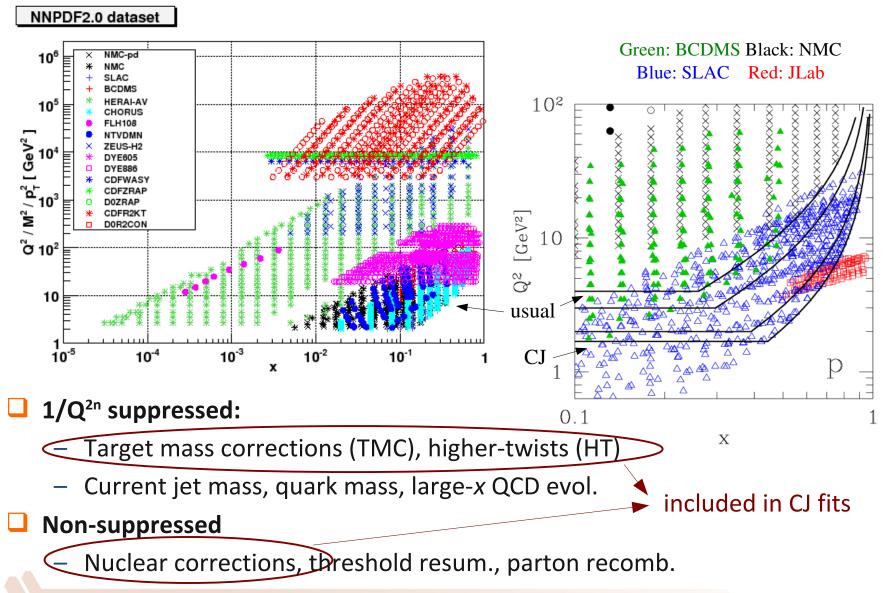

- Target mass corrections (TMC), higher-twists (HT)
- Current jet mass, quark mass, large-x QCD evolution

Non-suppressed

Nuclear corrections, threshold resum., parton recomb.

Large-x, small-Q² corrections

CJ fits: results in a nutshell

summary: Accardi, MENU2010 proceedings

- Standard cuts:
 - PDF insensitive to TMC, HT
 - Nuclear corrections not negligible (but usually neglected...)
- Looser kinematic cuts
 - PDFs stable as cut is varied about the largest allowed
 - Substantial reduction in "experimental" PDF errors
- Stability w.r.t. TMCs

Brady, Accardi, Hobbs, Melnitchouk, PRD 84, 074008 (2011)

- The fitted HT term compensates for differences in TMC models
 - Leading-twist PDFs have little systematic error (good!)
 - HT term has ≈ 50% uncert. (not so good, if you care for this...)

CJ fits: results in a nutshell

summary: Accardi, MENU2010 proceedings

- Standard cuts:
 - PDF insensitive to TMC, HT
 - Nuclear corrections not negligible (but usually neglected...)
- Looser kinematic cuts
 - PDFs stable as cut is varied about the largest allowed
 - Substantial reduction in "experimental" PDF errors
- Stability w.r.t. TMCs

Brady, Accardi, Hobbs, Melnitchouk, PRD 84, 074008 (2011)

- The fitted HT term compensates for differences in TMC models
 - Leading-twist PDFs have little systematic error (good!)
 - HT term has ≈ 50% uncert. (not so good, if you care for this...)
- New d-quark parametrization
 - Dramatic increase in d PDF in $x \rightarrow 1$ limit

Large sensitivity to nuclear model

...but large theoretical uncertainties (CJ11)

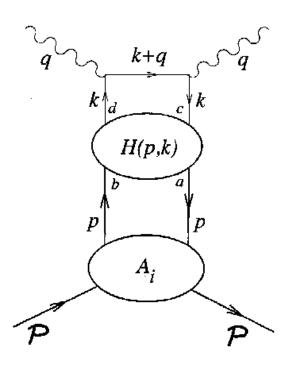

Nuclear corrections - theoretical uncertainty

$$F_{2d}(x_B,Q^2) = \int_{x_B}^A dy \, \mathcal{S}_A(y,\gamma) F_2^{TMC+HT}(x_B/y,Q^2) \left(1 + \frac{\delta^{off} F_2(x)}{F_2(x)}\right)$$
 Free nucleon str.fn.

"Smearing function"

Calculated from nuclear wave-function:

CD-Bonn
AV18
WJC-2
WJC-1
relativistic

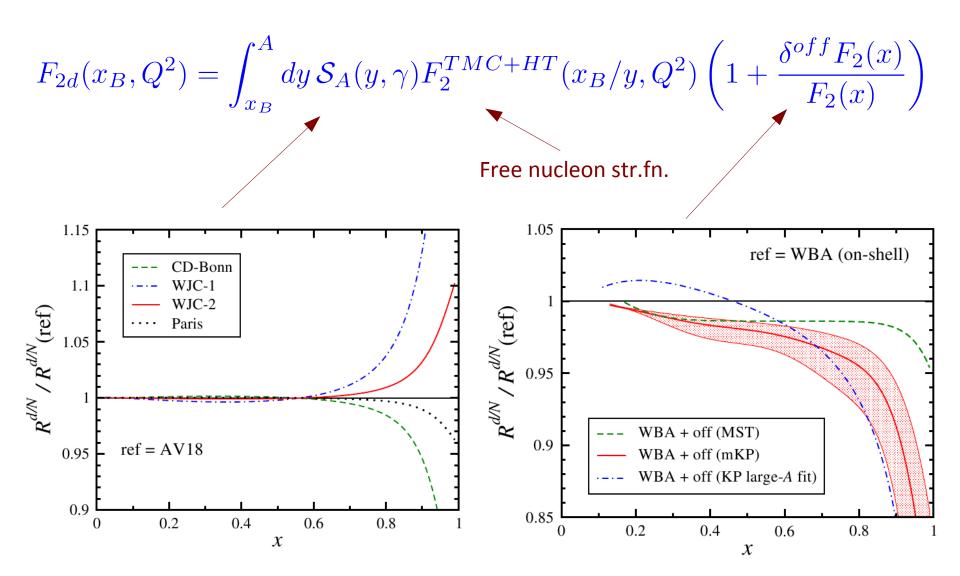

Off-shell correction

Models (little theory guidance):

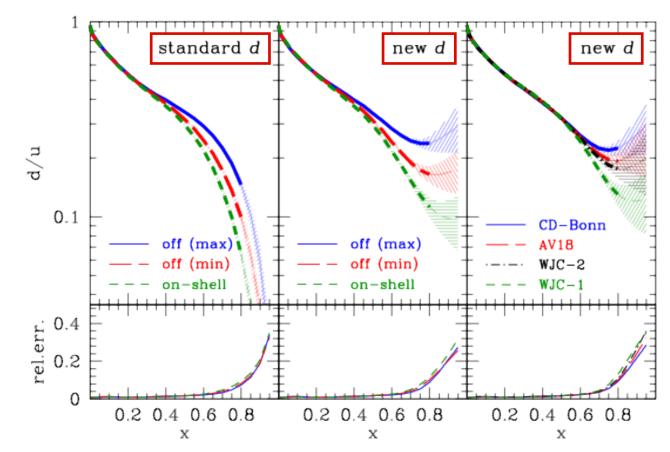

- Melnitchouk & C. (MST)
- Kulagin-Petti (KP) fits of A/d ratios
- modified KP model

Nuclear corrections - theoretical uncertainty

CJ fits: effect of d-quark parametrization

Accardi et al. PRD 84, 014008 (2011)

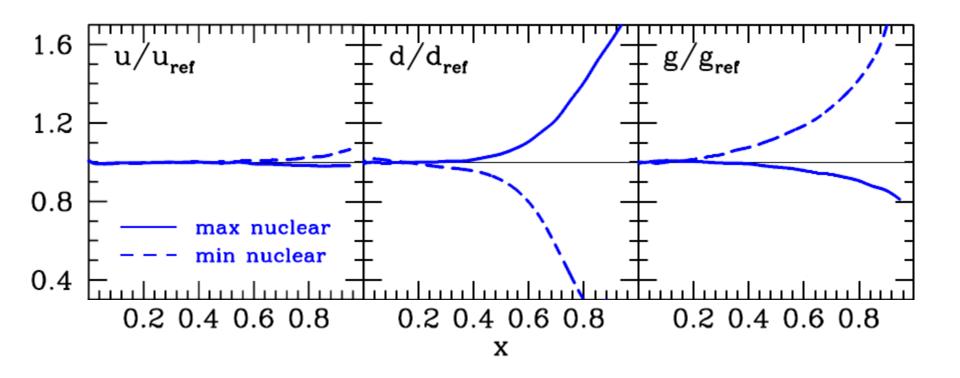

lacksquare Dramatic increase in d PDF in x ightarrow 1 limit with more flexible parametrization

$$d'(x) = d(x) + \alpha x^{\beta} u(x)$$

CJ fits: nuclear model systematic error

Accardi et al. PRD **84**, 014008 (2011)

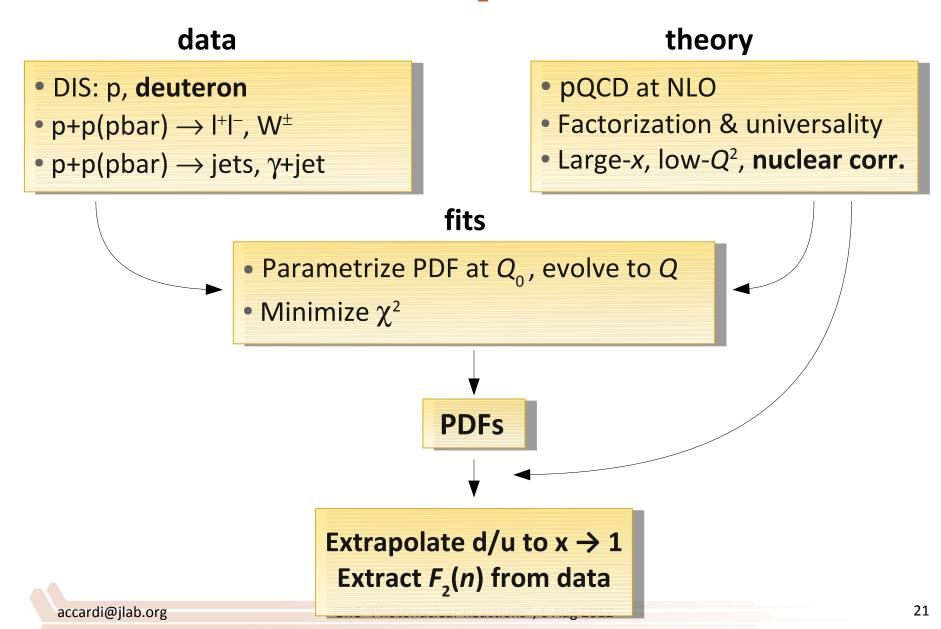

Large sensitivity to nuclear corrections model

- d-quarks: directly, due to corrections applied to $F_2(d)$
- gluons: due to correlations induced by jet data

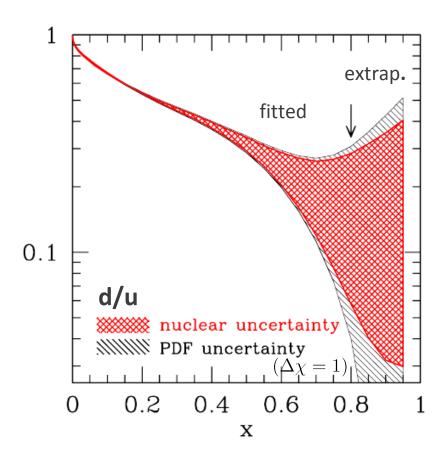

Application: The d/u ratio at $x \rightarrow 1$

PDF fitting and neutron $F_2(n)$

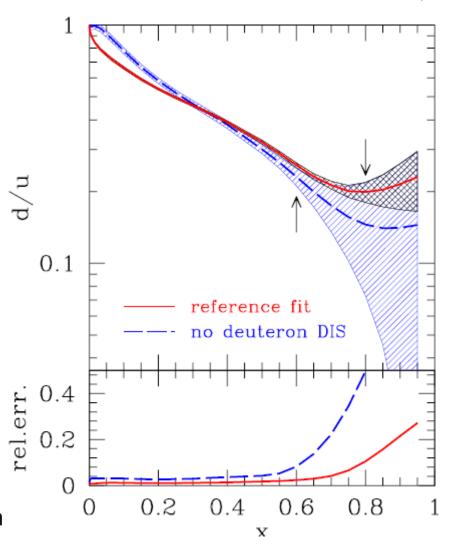

The CTEQ-JLab d/u

Accardi et al. PRD 84, 014008 (2011)

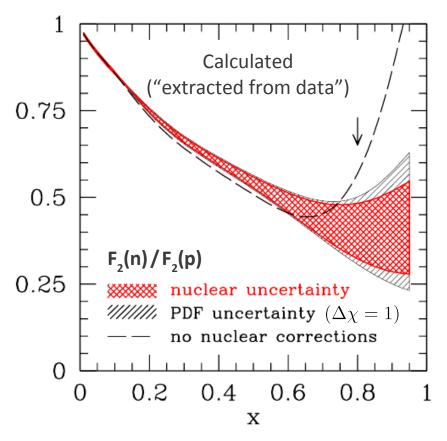

Nuclear uncertainty eats away improved statistics from low-W² data

The CTEQ-JLab $F_2(n) / F_2(p)$

Accardi et al. PRD 84, 014008 (2011)

- Well behaved extrapolation for each nuclear model
 - however, beware of PDF "parametrization bias"
- But: large nuclear uncertainty (covers all theory predictions)

Constraining nuclear corrections

Need data to constrain nuclear corrctions!

- Data minimally sensitive to nuclear corrections
 - DIS with slow spectator proton (BONUS, BONUS12)
 - Quasi-free neutrons
 - DIS with fast spectator (DeepX)
 - Off-shell neutrons but large, poorly controlled FSI
 - ³He/³H ratios (MARATHON)

JLab

- Data on free (anti)protons, sensitive to d or g
 - e+p: F_1 , parity-violating DIS **JLab, HERA** $(e^++p \ vs. \ e^-+p)$
 - v+p, $\overline{v}+p$ Minerva ???
 - p+p, $p+\overline{p}$ at large positive rapidity

• W charge asymmetry, Z rapidity distribution

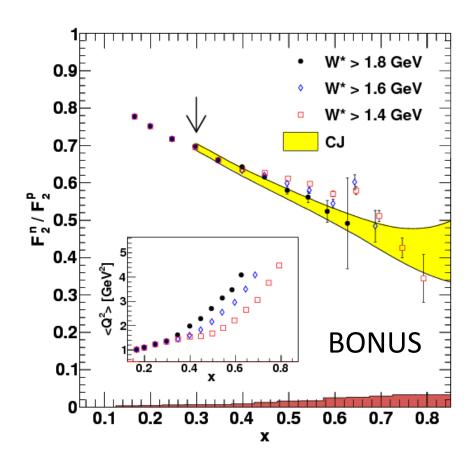

Tevatron, LHC RHIC ??

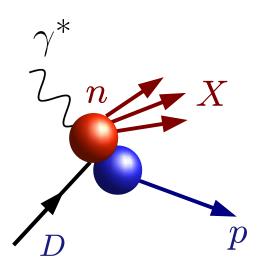

Cross-talk data

- p+d at large <u>negative</u> rapidity dileptons; maybe W, Z?
- RHIC??
- Sensitive to nuclear corrections, cross-checks e+d

Quasi-free neutrons from BONUS

N.Baillie et al., arXiv:1110.2770

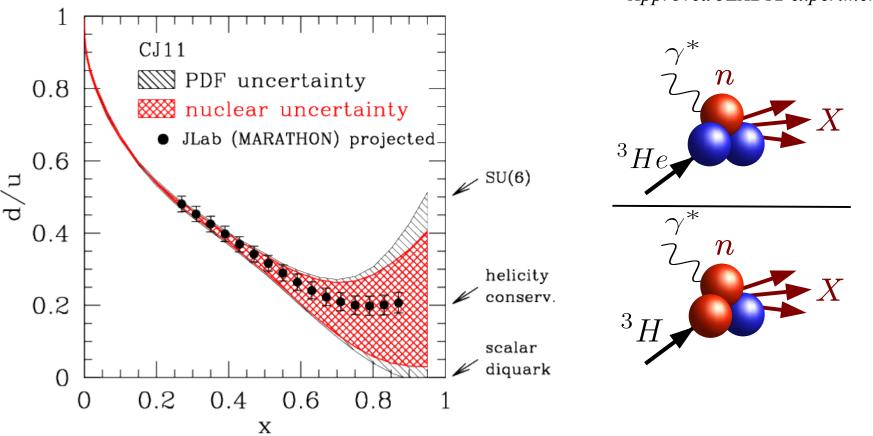

- \square DIS data (black disks) too uncertain at x > 0.5
 - Need to wait for BONUS12 / MARATHON

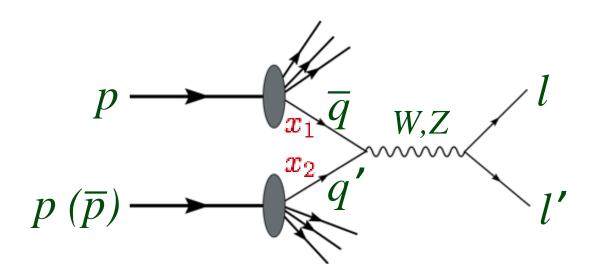

Quasi-free neutrons from MARATHON

Nuclear corrections largely cancel in the ratio fo 3He/3H cross sections

W,Z production

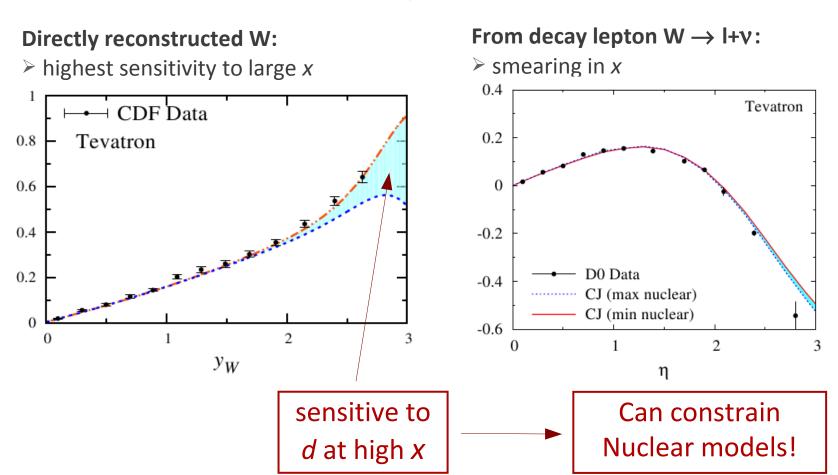

Example: W and decay lepton charge asymmetry at large rapidity

$$A_W(y) = \frac{\sigma_(W^+) - \sigma_(W^-)}{\sigma_(W^+) + \sigma_(W^-)} \approx \frac{d/u(x_2) - d/u(x_1)}{d/u(x_2) + d/u(x_1)}$$
 $[x_1 \gg x_2]$

$$A_l(y) = A_W \otimes B_{W \to l}(y)$$

W charge asymmetry at Tevatron

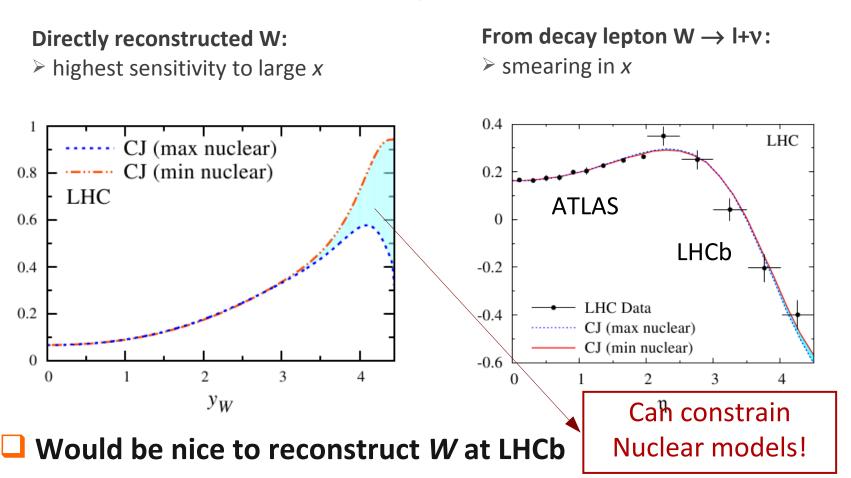

Brady, Accardi, Melnitchouk, Owens, arXiv:1110.5398, JHEP

- Too little large-x sensitivity in lepton asymmetry:
 - need reconstructed W

W charge asymmetry at LHC

Brady, Accardi, Melnitchouk, Owens, arXiv:1110.5398, JHEP

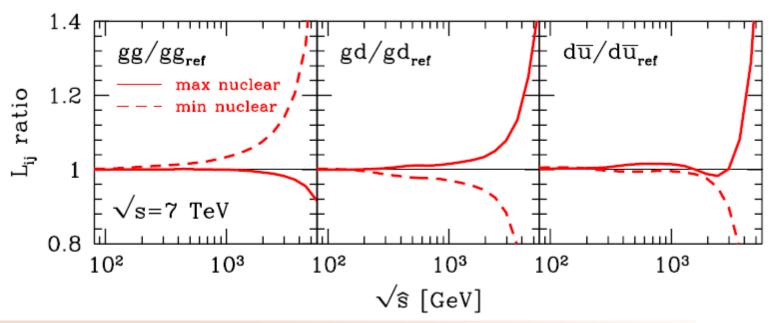

- Needs more statistics
- Systematics in W reconstruction?
- Is it at all possible?? (too many holes in detector)

Parton luminosity at colliders

Accardi et al. PRD 84, 014008 (2011)

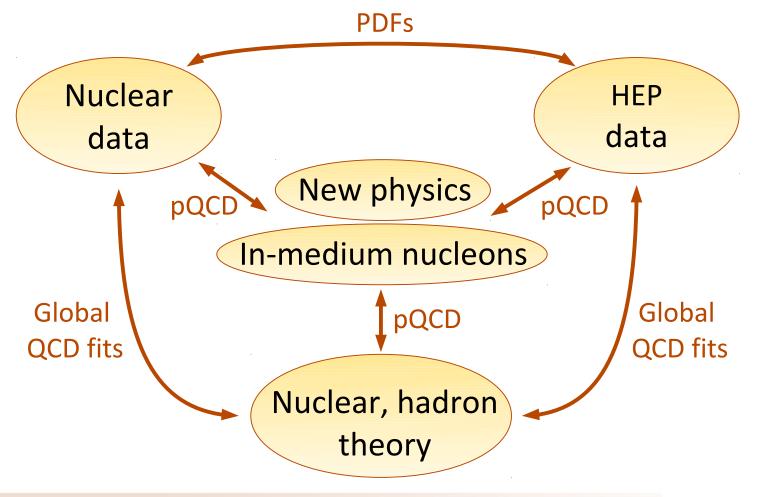

Large-x PDF uncertainties affect total cross sections for objects of large mass $\hat{s}=(p_1+p_2)^2=x_1x_2s$ (or large rapidity $x_{1,2}=\sqrt{\hat{s}/s}e^{\pm y}$)

$$L_{ij} = \frac{1}{s(1+\delta_{ij})} \left[\int_{\hat{s}/s}^{1} \frac{dx}{x} f_i(x,\hat{s}) f_j\left(\frac{\hat{s}}{xs},\hat{s}\right) + (i \leftrightarrow j) \right]$$

Summary

- Ongoing CTEQ-JLab global fits attacking large-x PDFs:
 - integrate across hadronic physics, connect with rest of subatomic physics

Plans

In preparation / near future

- Fits with latest data (HERA, large-x DIS cross sections, LHC @ 7 TeV)
- Correlated errors where available; tensions between data sets
- Public release of PDF + error sets (and accompanying sfw)
- LHC / RHIC phenomenology; will be ready for JLab 12 GeV, E906, ...

Longer term

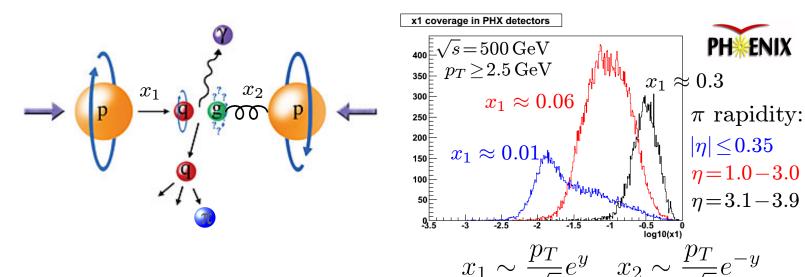

- F₁ / σ data on deuterium (large-x gluons); heavy quarks
- large-x resummation, jet mass corrections, quark-hadron duality
- better off-shell corrections, extend to gluons

Backup slides

Small x gluons at colliders: hadronic structure

 \Box Gluon spin at small x at RHIC requires particle production at large y

$$\sigma(\vec{p}\vec{p} \to \pi^0 X) \propto \Delta q(x_1) \Delta g(x_2) \hat{\sigma}^{qg \to qg} D_q^{\pi^0}(z)$$

- Precise large-x PDFs needed:
 - to measure smallest-x gluon helicity

Valence quarks at large x

- \Box d/u quark ratio particularly sensitive to quark dynamics in nucleon
- SU(6) spin-flavor symmetry
 - proton wave function

$$p^{\uparrow} = -\frac{1}{3} d^{\uparrow}(uu)_1 - \frac{\sqrt{2}}{3} d^{\downarrow}(uu)_1$$

$$+ \frac{\sqrt{2}}{6} u^{\uparrow}(ud)_1 - \frac{1}{3} u^{\downarrow}(ud)_1 + \frac{1}{\sqrt{2}} u^{\uparrow}(ud)_0$$
 interacting quark spin quark spectator diquark

Valence quarks at large x

- \Box d/u quark ratio particularly sensitive to quark dynamics in nucleon
- SU(6) spin-flavor symmetry
 - proton wave function

$$p^{\uparrow} = -\frac{1}{3}d^{\uparrow}(uu)_{1} - \frac{\sqrt{2}}{3}d^{\downarrow}(uu)_{1}$$
$$+ \frac{\sqrt{2}}{6}u^{\uparrow}(ud)_{1} - \frac{1}{3}u^{\downarrow}(ud)_{1} + \frac{1}{\sqrt{2}}u^{\uparrow}(ud)_{0}$$

 $-50\% (qq)_1 50\% (qq)_0$, u = 2d at all x

$$\frac{d}{u} = \frac{1}{2} \implies \frac{F_2^n}{F_2^p} = \frac{2}{3}$$

Valence quarks at large x

- Broken SU(6) : scalar diquark dominance
 - $-M_{\Delta} > M_{N} \Rightarrow (qq)_{1}$ has larger energy than $(qq)_{0}$
 - But only u quark couples to scalar diquark:

$$\frac{d}{u} \to 0 \implies \frac{F_2^n}{F_2^p} \to \frac{1}{4}$$

Feynman 1972, Close 1973 Close/Thomas 1988

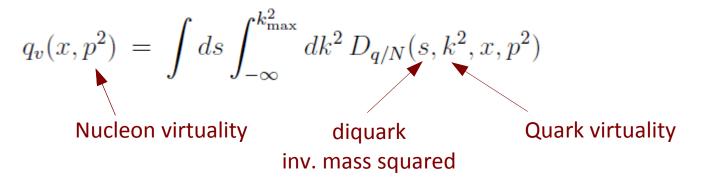

- Broken SU(6): hard gluon exchange
 - helicity of struck quark = helicity of struck hadron

Farrar, Jackson, 1975

The mKP off-shell nucleon model

Accardi et al. PRD 84, 014008 (2011)

 \square Nucleon at large x = valence quark + spectator diquark

Quark spectral function, with spectator diquark

$$D_{q/N} \; \approx \; \delta(s-s_0) \, \Phi(k^2, \Lambda(p^2)) \qquad [s_{_0} = \text{2.1 GeV^2 from fits}]$$
 Cutoff scale

- Physical interpretation: nucleon size changes with p^2 : $R_N \sim 1/\Lambda$

Valence quarks at large x

- Broken SU(6) : scalar diquark dominance
 - $-M_{\Delta} > M_{N} \Rightarrow (qq)_{1}$ has larger energy than $(qq)_{0}$
 - But only u quark couples to scalar diquark:

$$\frac{d}{u} \to 0 \implies \frac{F_2^n}{F_2^p} \to \frac{1}{4}$$

Feynman 1972, Close 1973 Close/Thomas 1988

- Broken SU(6): hard gluon exchange
 - helicity of struck quark = helicity of struck hadron

Farrar, Jackson, 1975

The mKP off-shell nucleon model

Accardi et al. PRD **84**, 014008 (2011)

Expand $F_2(N)$ to first order in virtuality:

$$F_2^N(x,Q^2,p^2) = F_2^N(x,Q^2) \left(1 + \delta f_2(x,Q^2) \frac{p^2 - M^2}{M^2}\right)$$

In the mKP model

$$\delta f_2 = c + \frac{\partial \log q_v}{\partial x} x(1-x) \frac{(1-\lambda)(1-x)M^2 + \lambda s_0}{(1-x)^2 M^2 - s_0}$$

Only 1 free parameter

$$\lambda = \partial \log \Lambda^2/\partial \log p^2 \Big|_{p^2=M^2} = -2(\delta R_N/R_N)(\delta p^2/M^2)$$
 ysical interpretation:
$$\delta p^2 = \langle p^2 - M^2 \rangle$$

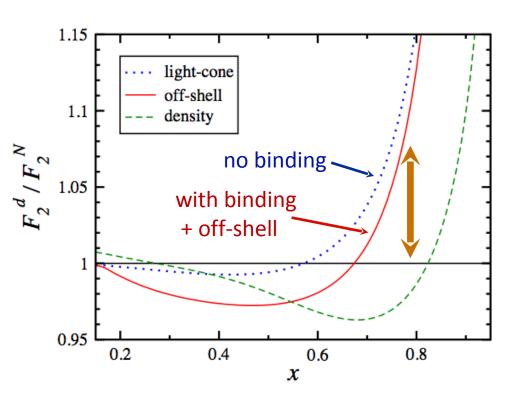

Physical interpretation:

nucleon size changes with p^2 : $R_N \sim 1/\Lambda$

$$\delta p^2 = \langle p^2 - M^2
angle$$
 one of $d^4p(p^2-M^2)\mathcal{S}_d(y)$ 41

Nuclear corrections

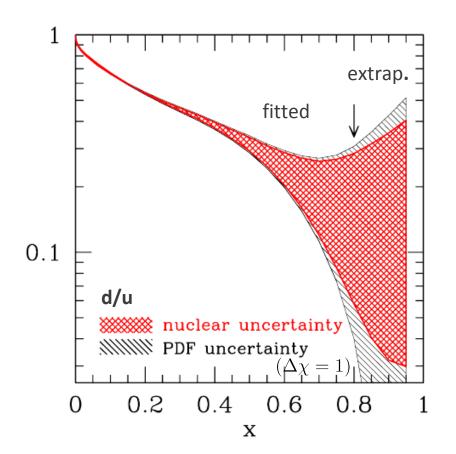

$$F_{2d}(x_B, Q^2) = \int_{x_B}^{A} dy \, \mathcal{S}_A(y, \gamma) F_2^{TMC + HT}(x_B/y, Q^2) \left(1 + \frac{\delta^{off} F_2(x)}{F_2(x)} \right)$$

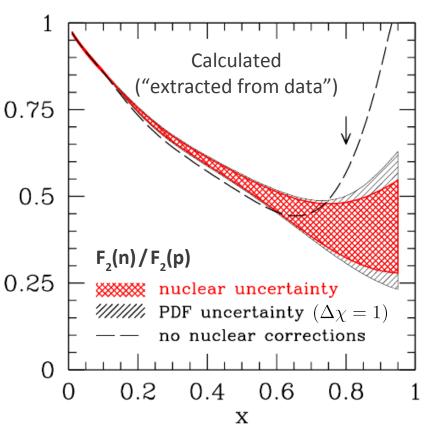

- Using off-shell model, obtains larger neutron (larger d) than light-cone model
- But smaller neutron (larger d) than no nuclear effects or density model

The CTEQ-JLab d/u and $F_2(n)$

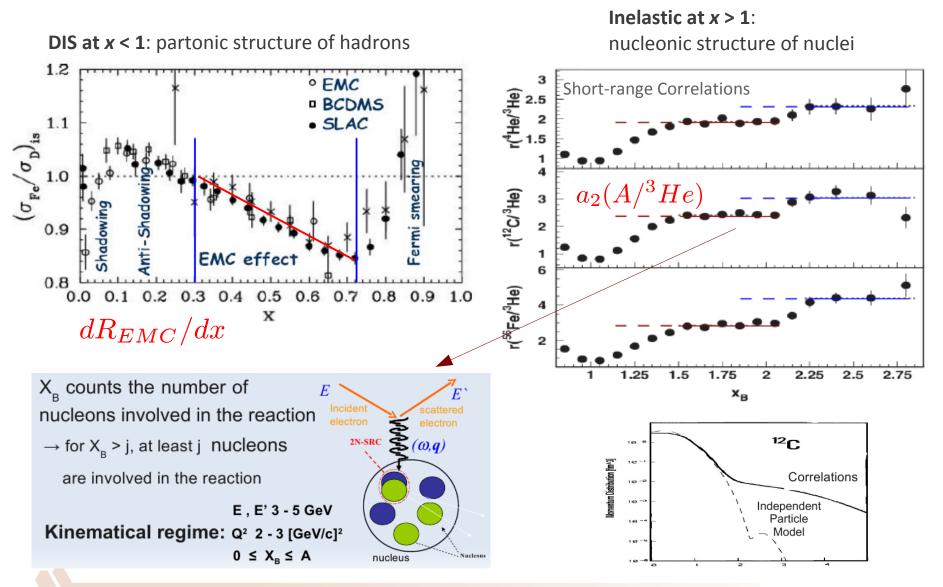

Accardi et al. PRD 84, 014008 (2011)

- Well behaved extrapolation for each nuclear model
 - however, beware of PDF "parametrization bias"
- But: large nuclear uncertainty (covers all theory predictions)

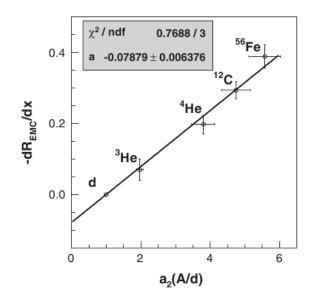

In the meantime... look at x>1

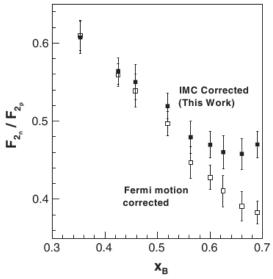

SRC/EMC correlation

- There is a definite correlation
- Why? Speculations...
 - Hard tail of nuclear w.f.
 shifts strength to higher x
 - Parton structure modified by short-range interaction
 - ...
- Will be studied experimentally
 - e.g., is the EMC effect different when tagging a fast spectator?
 - the faster the more off-shell: p² dependence?
- \square Extrapolate to deuterium, extract $F_2(n)$

Weinstein et al., PRL 106 (2011) 052301

IMC constraints on deuteron corrections

Hen, Accardi, Melnitchouk, Piasetzky, PRC 2012

4 wave-functions, 1 free off-shell parameter each

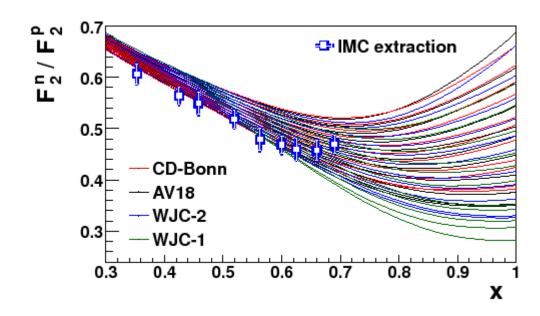

$$\lambda_{off} = -2\frac{\delta R}{R} \frac{\delta p^2}{p^2}$$

Bound nucleon swelling:

- model (Close et al. 1985) ~1.2%

- fits: 0-3% range

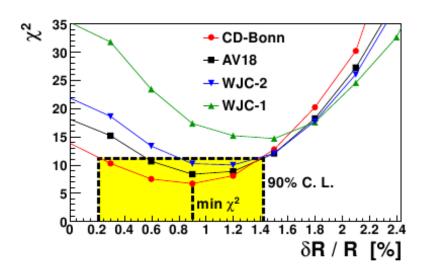

Average nucleon virtuality, fixed by wave-function choice

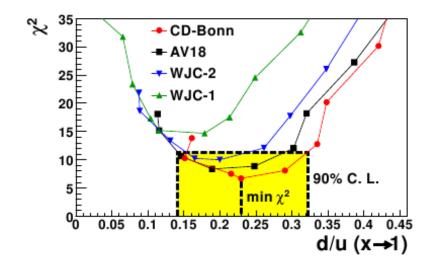

IMC constraints on deuteron corrections

Hen, Accardi, Melnitchouk, Piasetzky, PRC to appear

- IMC extracted data constrains nuclear model, and d/u ratio
 - Treat choice of w.f. as a (continuous) free parameter

Clearly indicates mild to medium off-shell corrections

$$\delta R/R = 0.2\% - 1.4\%$$

Disfavors hard wave-functions
 such as WJC-1

- Excludes models based on
 - SU(6) symmetry
 - Scalar di-quark dominance

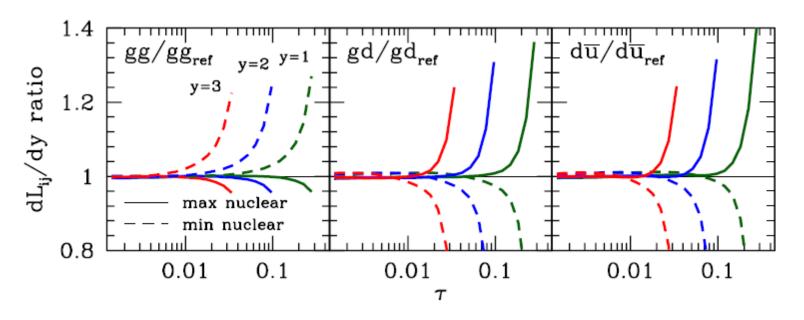

$$d/u \to 0.23 \pm 0.09$$

Parton luminosities

Accardi et al. PRD 84, 014008 (2011)

... or large rapidity:

$$\frac{x_{1,2}=\tau e^{\pm y}}{dy} = \frac{1}{s(1+\delta_{ij})} \left[f_i(\tau e^{\hat{y}},\hat{s}) f_j(\tau e^-y,\hat{s}) + (i\leftrightarrow j) \right]$$

(Note: ratios are largely independent of s)
